

Simply universal

Monobond®
Plus

Universal primer

Versatile applications

Correct preparation of the adhesive surfaces of a restoration is an essential part of the adhesive cementation process. Monobond® Plus is a universal primer for conditioning all common restorative materials in everyday practice.

Impressive performance
Used together with the versatile luting composite Variolink® Esthetic DC, Monobond Plus ensures a reliable bond to zirconium oxide and glass-ceramics.^[2]

Durability of the bond established to zirconium oxide and lithium disilicate by different primer/bonding systems ^[2]
[Tensile bond strength after immersion in water for 150 days and 37,500 cycles of thermocycling]

A primer for a wide variety of materials
Monobond Plus contains an innovative combination of functional monomers that promote a strong bond to zirconium oxide, glass-ceramics and metal alloys – comparable to the performance of bonding agents for single materials.^[1]

Uniform application protocol with a 60-second contact time
Monobond Plus is used in the same way on all restorative materials: apply, allow to react for 60 seconds and disperse excess.

Fixed prosthetics workflow for individual and reliable restorations

Isolate

Establish relative isolation and an easily manageable treatment field with OptraGate

Scan and send

Convenient digital impression taking and immediate transfer of data via Ivoclar Cloud

Select

IPS e.max: all-ceramic materials for nearly all restorative indications

Plan

Select the suitable cementation protocol using the Cementation Navigation System

Condition

Simply condition the bonding surface of a restoration with Monobond Plus

Bond

Generate a strong bond to the tooth structure together with Adhese Universal

Cement

Reliable and versatile adhesive cementation with Variolink Esthetic

Protect

Protect restorations with the unique combination of active ingredients contained in Cervitec Plus
